Positive Impact of Meshing Autogenous Dermal Matrix (ADM) on Pain, Length of Stay and Length of Time Required for Post-Operative Drains in Tissue Expander Based Breast Reconstruction

Sarah E Hagarty, BS, MD, Lawrence Yen, BS, Christopher Fosco, MD, Manorama Khare, PhD.

Introduction: Seroma rates when ADM is used in tissue expander based breast reconstruction have been of concern. The impact of fenestrating and perforating various ADMs has been studied. We tested a simple and reproducible method to mesh ADM. We hypothesized this would have a positive impact on postoperative drainage.

Materials and Methods: Thin AlloDerm® was meshed with either a Brennan® or Zimmer® device for expander based reconstruction in a single surgeon practice over 2 years. This cohort was compared to a previous cohort, with unmeshed ADM. Drain times, length of stay (LOS), parenteral narcotic usage (mg morphine), and complication rates were compared: 36 meshed versus 116 unmeshed breasts, 19 and 84 patients respectively. T-test and Levine’s test for equality of variances were employed. Outcomes in the two groups were analyzed, controlling for variables: diabetes, hypertension, smoking status, BMI, expander size, fill volume, and prior radiation therapy. Follow up was 2 and 8 years respectively.

Results: In bivariate analysis, mean time for drain removal was 18(+/-5) days in meshed, versus 29(+/-19) days unmeshed, (p <0.001). Parenteral narcotic use decreased in the meshed group, (6.8 versus 29 mg morphine, p< 0.002), with no difference in intraoperative fill volumes. LOS decreased from 1.8 to 1.1 days, (p<0.002). Complication rates were not significantly different. Minor complications trended lower (13.9 % meshed versus 27.4%, p=0.09). Major complication rates (8.3% meshed versus 4.8%) were not significantly different, (p=0.42). Prior radiation was higher in the meshed group (21% versus 2%). The major complication rate trended lower (0% versus 4.8%), when discounting prior radiation.

Conclusions: We present a novel, and easily reproducible technique to manipulate ADM, resulting in a significant decrease in time for drains, use of parenteral narcotics, and length of stay. Further statistical analysis is pending with a larger cohort to determine if differences in complication rates will reach statistical significance.

ABSTRACT PREPARATION AUTHOR CHECKLIST

Use this checklist to help you include all required elements of your submission. **Please complete the checklist and submit it with your Final Synopsis. Note: Although all items are necessary, authors must sign off on this checklist the items indicated in red.**

- Title of abstract is exactly as it should appear in print
- List of authors with no more than 3 highest academic degrees
- All authors’ full financial disclosures listed
- References: Called out numerically in manuscript; Works Cited (AMA style)
- List of figure and table legends, including credit lines
- Figure and table call-outs in text
- Copies of signed patient release forms for the use of all photographs in which patients can be identified.
- High quality color figures, properly prepared according to the guidelines
- Upload version of abstract with all pieces separate (Final Synopsis-.DOC; Figures-.TIF; Tables-.DOC)
- Upload version of abstract with all pieces assembled in-line (as a PDF)
